

# InVEST: Quantifying ecosystem services

Taylor Ricketts  
Emily McKenzie

Natural Capital Project  
World Wildlife Fund – U.S.

# Challenge: mainstreaming ES

- “You can only manage what you can measure.”
- Provide tools to incorporate ecosystem services into decisions and policies
- Questions:
  - Where do ES come from?
  - Who do they benefit (or not)?
  - How will they change in future?
- Evaluate choices, quantify tradeoffs

# The Natural Capital Project

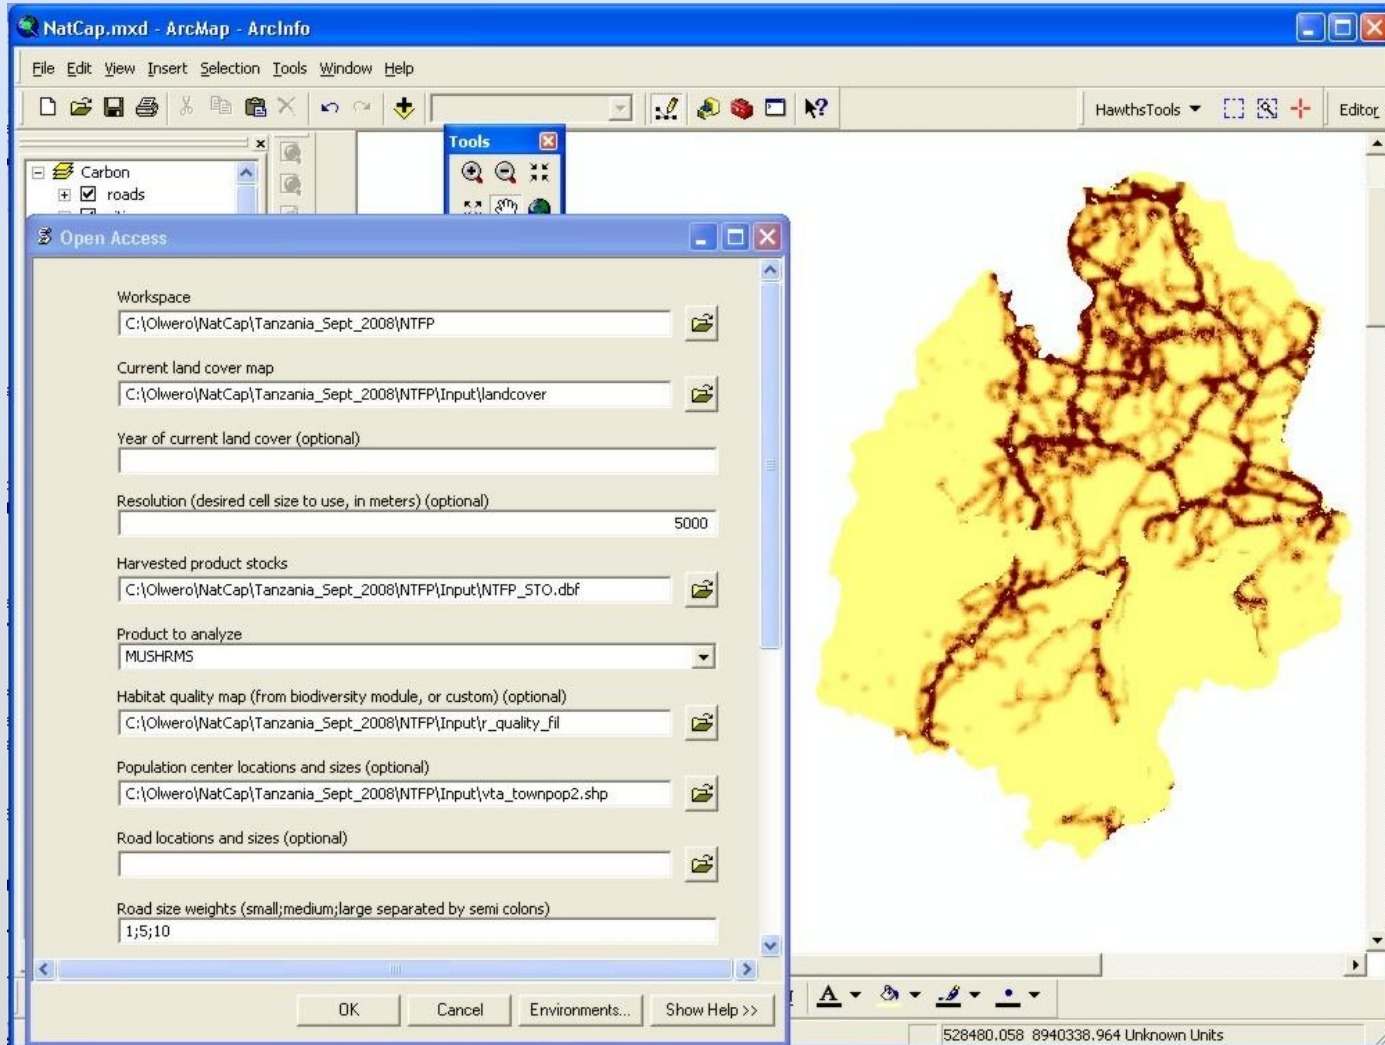

natural  
capital  
PROJECT

- Develop tools to map, value ecosystem services
- Test & apply tools in critical regions
- Support policies to maintain / pay for services

UNIVERSITY OF MINNESOTA  
Driven to Discover™

# InVEST

# Multiple ecosystem services

Carbon storage

Non-timber forest products

Sediment retention

Water purification

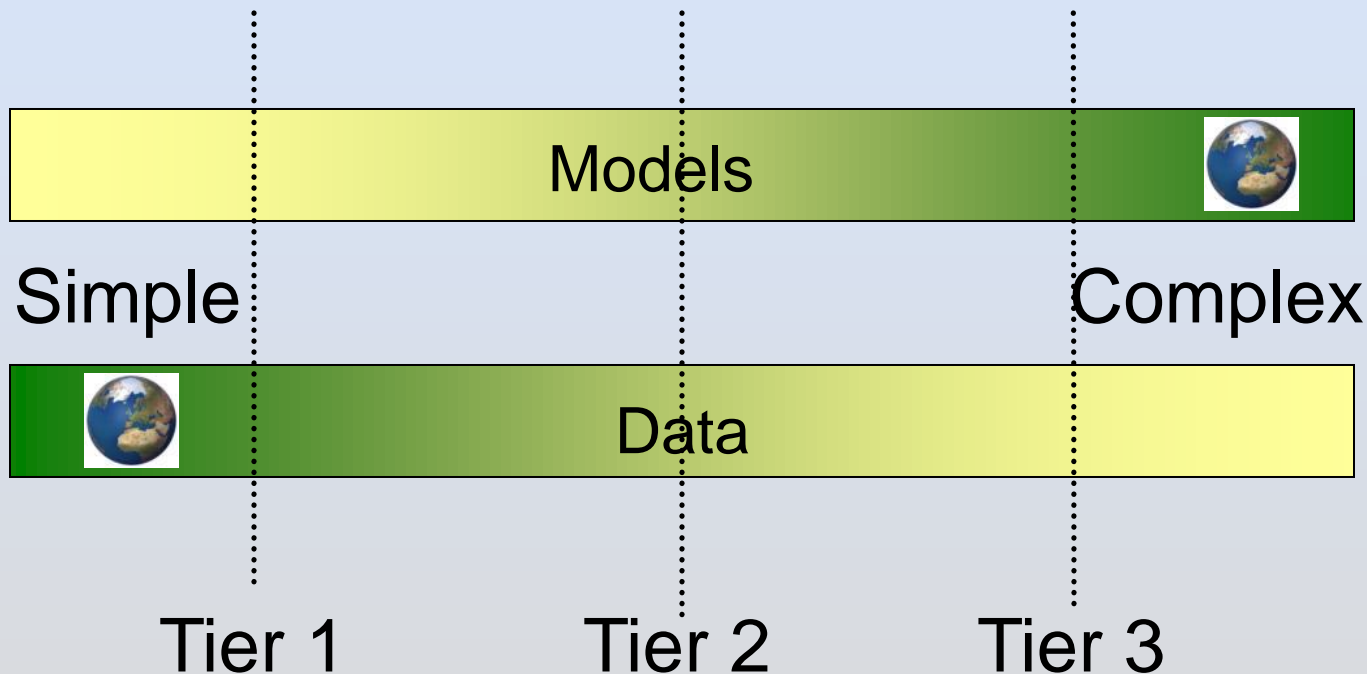

Coastal storm protection

Crop pollination

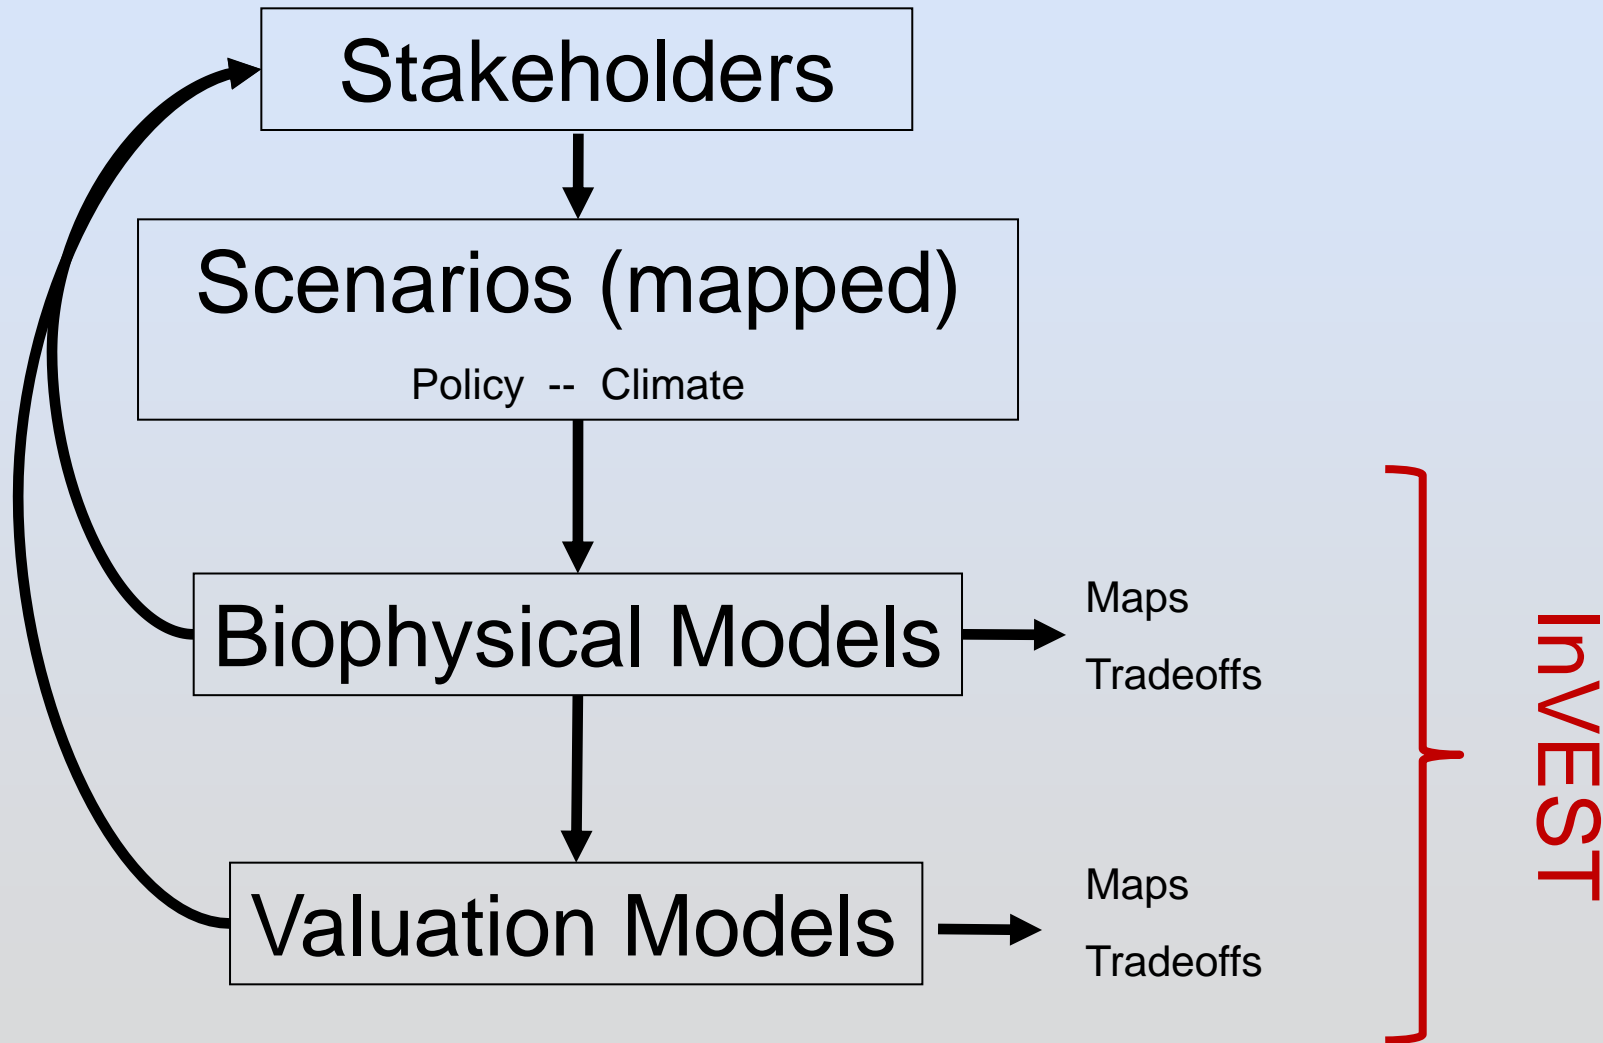

Fish production

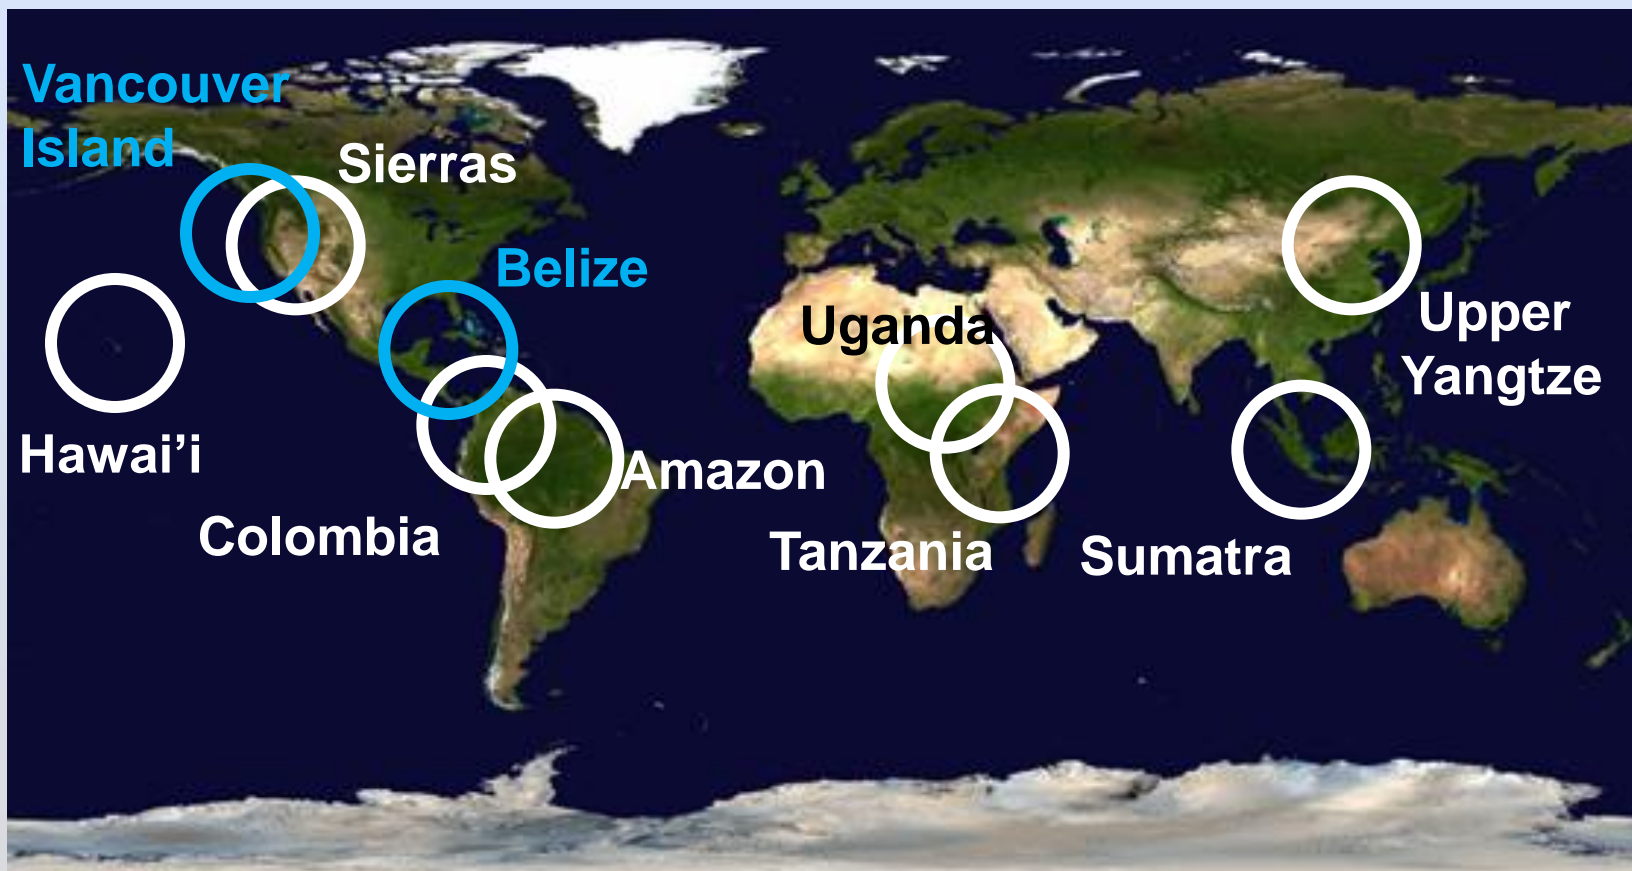

# A Tiered Approach

# Informing decisions

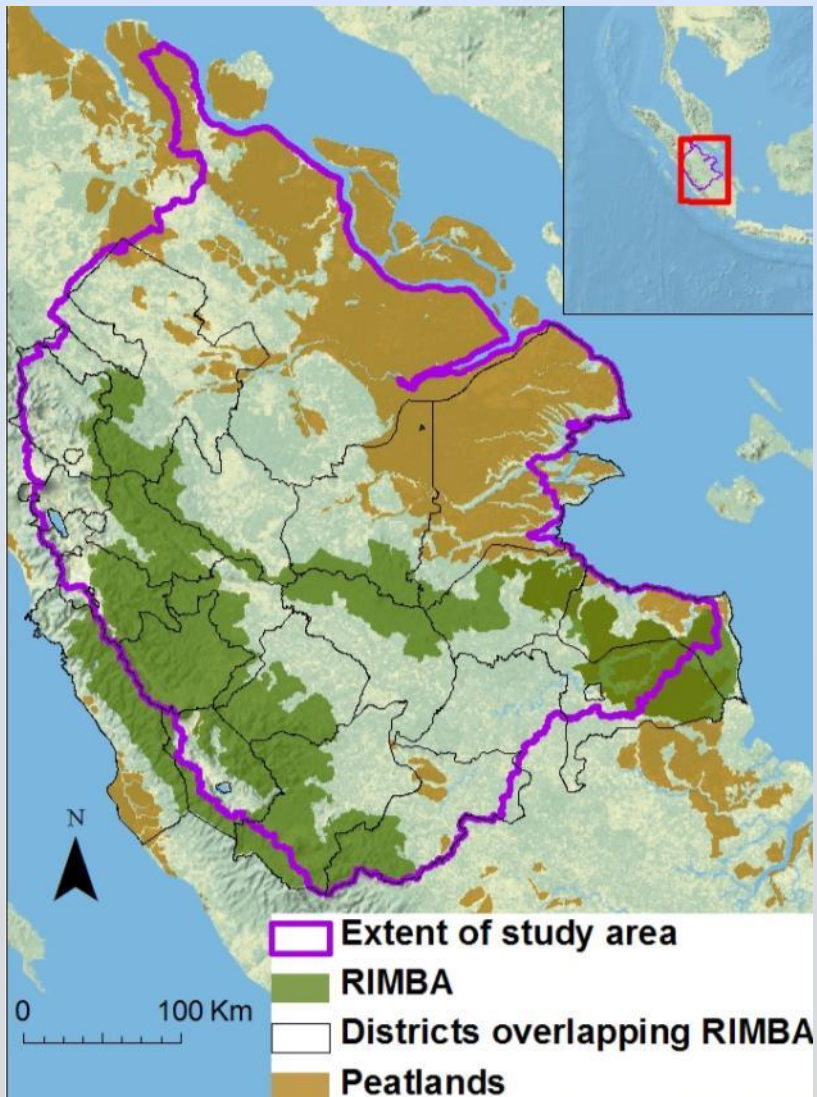

# Demonstration Sites

- Test InVEST with field partners and experts
- Advance concrete policy goals
- Roll up / share lessons

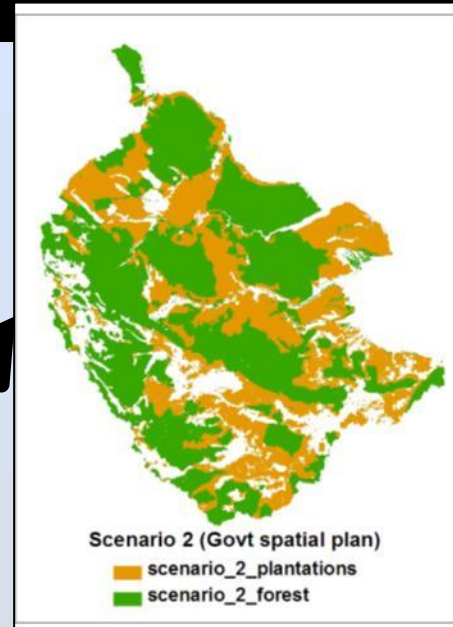

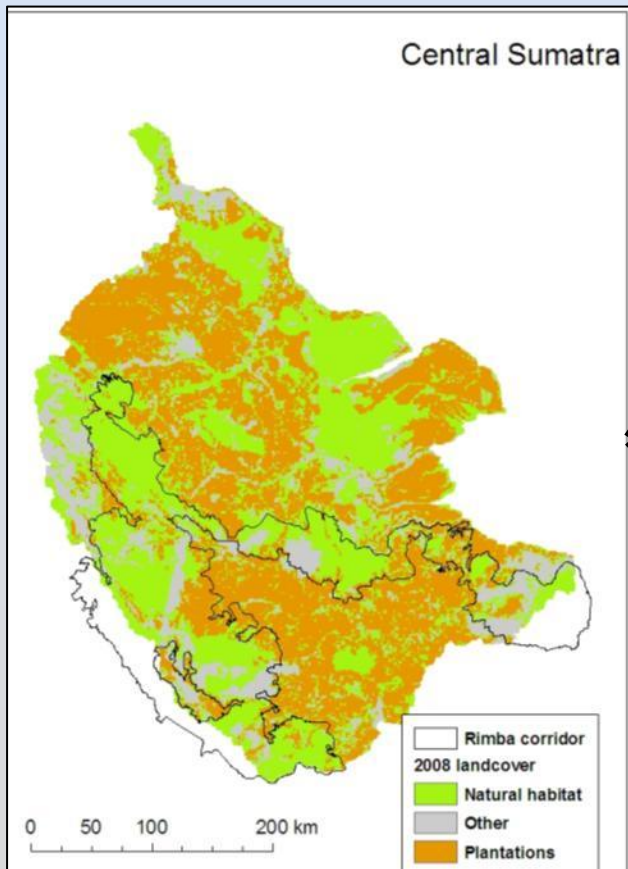

# Central Sumatra

- Island-wide land-use planning
  - Now at district scale
- Governors' commitment
  - Planning
  - Incentives
- Our role:
  - map sources of ES
  - Recommend options to capture values

# Accounting for carbon changes

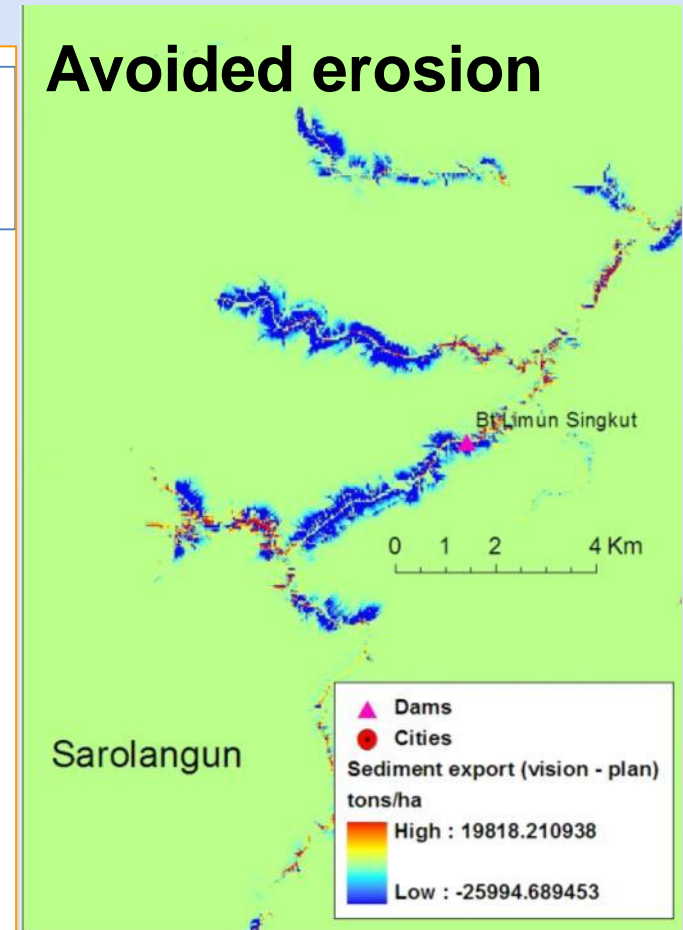

# Tradeoff analyses

## Sarolangun

## Avoided erosion

# Production function

- Carbon storage

~  $f(\text{veg, storage/ha, harvest, decay})$

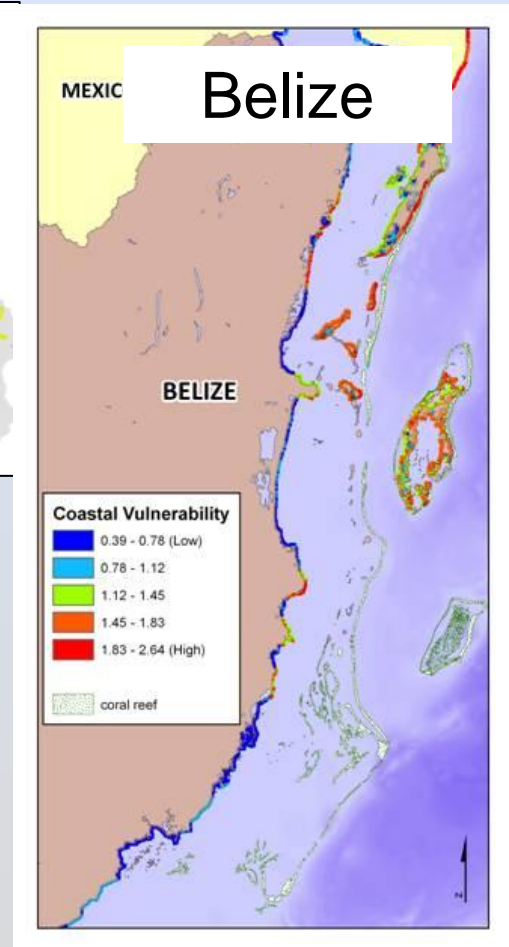

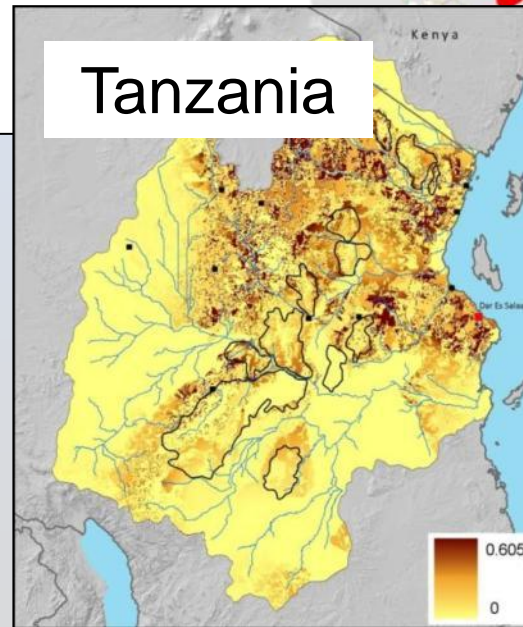

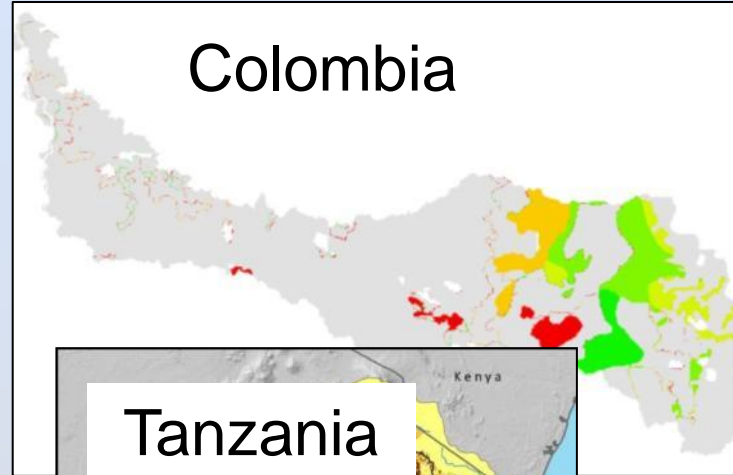

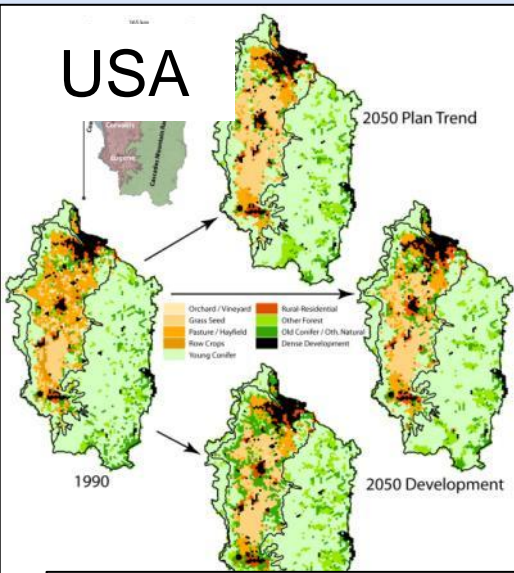

- Inputs: land use/cover, C densities, harvest rates, decay rates of harvested wood.
- Outputs: C stored/ha
- Valuation: damage costs avoided

## Sediment retention

~  $f(\text{soil, slope length, veg, rain, neighbors})$

- Inputs: land use/cover, topography, soils, precip, basins
- Outputs: tons sediment retained/ha
- Valuation: replacement costs avoided (dredging)

# Other projects

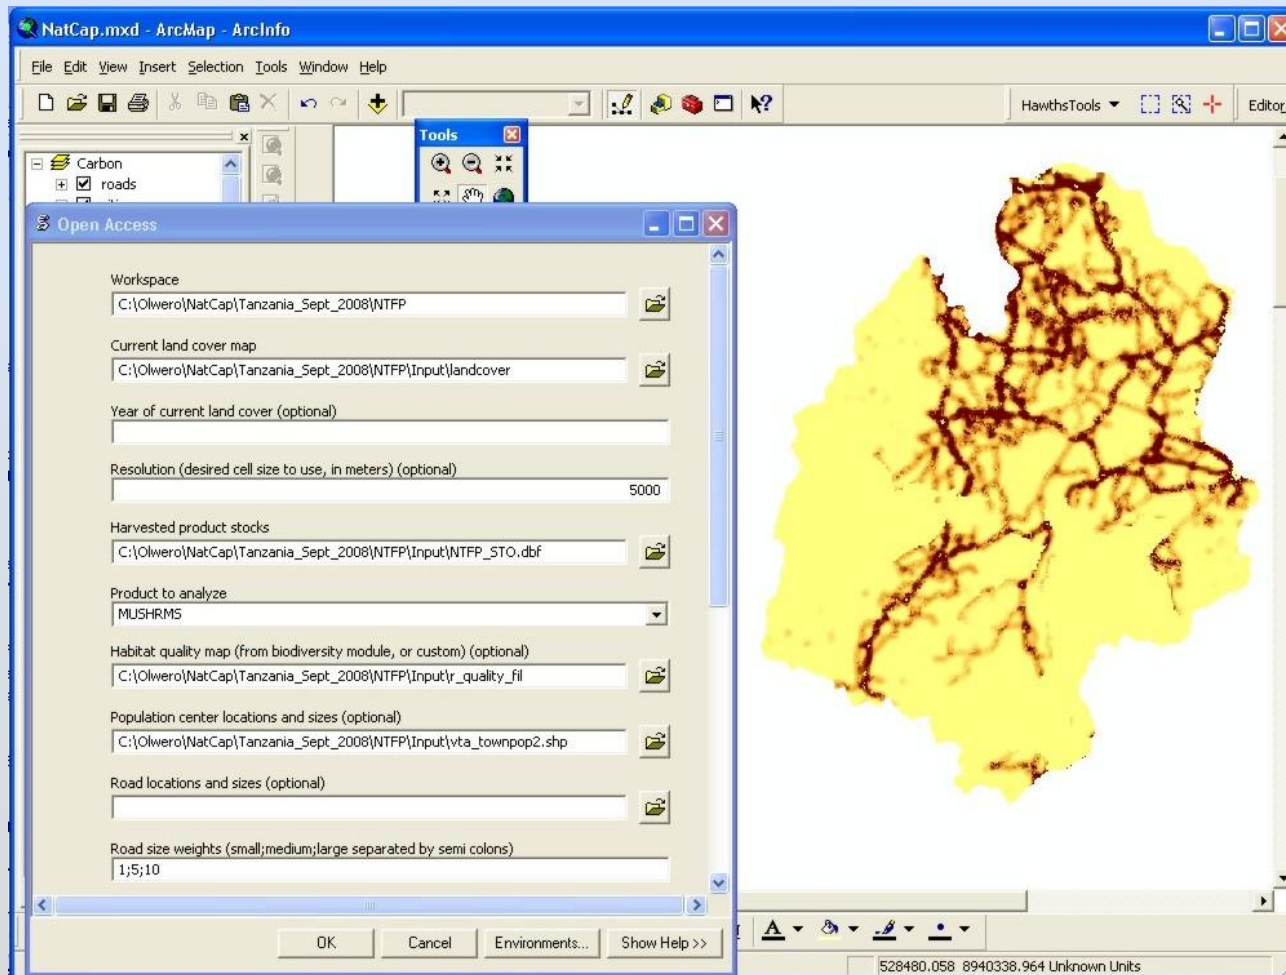

- Range of policy contexts
- TEEB case studies

# Capacity building

(MA Sub-global assessment, ProEcoServe)

# Engaging people

# InVEST attributes

- Multiple services and tradeoffs
- Spatially explicit (mapped)
- Production functions
- Evaluate CHANGE: choices, tradeoffs
- Simple
- Open source – many contributors, updates
- To date: subnational, but early national trials

# Challenges

- Data – even for tier 1 models
- Capacity to interpret and apply
- Water-related services
- Governmental silos

# How can InVEST\* help?

- Identify key sources of ES (Kirk)
- Make ES “visible” in Nat. Accounts (Glenn-Marie)
- Demonstrate value, regardless of capture (Pavan)
- Quantify, map externalities (Kirk)
- Retain spatial data within national accounts (G-M)

# What are we measuring?

	<b>Timber Production</b>	<b>Crop Pollination</b>
<b>Supply</b>	Standing stock of wood (cubic feet ha <sup>-1</sup> )	Insect abundance (# insects ha <sup>-1</sup> )
<b>Use-intermediate service</b>	None	Insect abundance contributing to crop (# of insects ha <sup>-1</sup> )
<b>Use- final service</b>	Harvested wood (cubic feet ha <sup>-1</sup> )	Crop yield due to insects (kg crop ha <sup>-1</sup> )
<b>Value</b>	NPV of harvested timber (\$ ha <sup>-1</sup> )	NPV of additional crop yield (\$ ha <sup>-1</sup> )
